---

## Are You Smarter Than a 4<sup>th</sup> Grader?

Trinity Episcopal School

*February 12, 2014*

# Try the following problem:

---

$$89 \times 25$$

*Is this how you solved it?*

---

$$\begin{array}{r} \phantom{0}1 \\ \phantom{0}\cancel{4} \\ 89 \\ \times 25 \\ \hline 445 \\ + 1780 \\ \hline 2225 \end{array}$$

# How Would a Mathematician Solve It?

---

Ann Dowker (1992) asked 44 mathematicians to estimate several typical multiplication and division computation problems, one of which was  $76 \times 89$ , and assessed their strategies. Only 4% of the responses represented the use of the standard algorithm. **The mathematicians looked at the numbers first and then found elegant, efficient strategies that seemed appropriate for the numbers.** They made the numbers friendly (often by using landmark numbers), and they played with relationships.

# How Do Students in Other Countries Solve It?

Liping Ma (1999) compared the way Chinese and American teachers think about and teach the multiplication algorithm and how they work with students who make place value mistakes. Most Chinese teachers approach the teaching of the multiplication algorithm conceptually. They explain the distributive property and break the problem up into the component problems.

$$89 \times 25$$

$$=(80+9) (20+5)$$

$$=(80 \times 20) + (80 \times 5) + (9 \times 20) + (9 \times 5)$$

$$=1,600 + 400 + 180 + 45$$

$$=2,225$$

# Traditional Algorithm

---

In contrast, 70% of American teachers teach the algorithm as a series of procedures and interpret students' errors as a problem with regrouping and lining up.

Constance Kamii (1993), a well-known researcher in the area of mathematics, suggests that “teaching the traditional algorithm can be harmful to students as they have to give up their own meaning-making in order to adopt the teacher’s procedures.”

36.0	Peru	Colombia, Indonesia

1. Footnote by Turkey: The information in this document with reference to "Cyprus\*" relates to the southern part of the Island. There is no single authority representing both Turkish and Greek Cypriot people on the Island. Turkey recognises the Turkish Republic of Northern Cyprus (TRNC). Until a lasting and equitable solution is found within the context of the United Nations, Turkey shall preserve its position concerning the "Cyprus issue".

2. Footnote by all the European Union Member States of the OECD and the European Union: The Republic of Cyprus is recognised by all members of the United Nations with the exception of Turkey. The information in this document relates to the area under the effective control of the Government of the Republic of Cyprus.

Countries and economies are ranked in descending order of the mean mathematics score in PISA 2012.

# Multiplication Using Distribution

$$89 \times 25$$

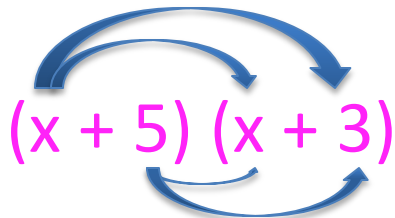

$$=(80+9)(20+5)$$

$$=(80 \times 20) + (80 \times 5) + (9 \times 20) + (9 \times 5)$$

$$=1,600 + 400 + 180 + 45$$

$$=2,225$$

*Having a solid understanding of the distributive property makes the transition to Algebra seamless.*

$$(x+5)(x+3)$$

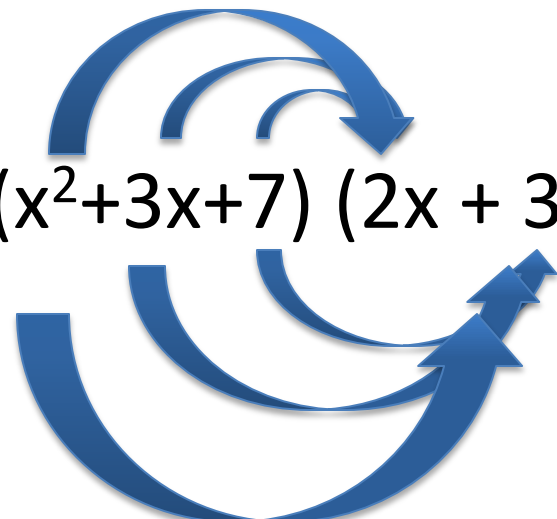

*Do you remember the FOIL method in Algebra?*

$$(x \bullet x) + (x \bullet 3) + (x \bullet 5) + (5 \bullet 3)$$

# Distribution

*Knowing FOIL doesn't help with this expression.  
But knowing distribution does!*

$(x^2 + 3x + 7)(2x + 3)$

# Student - Example A

$$89 \times 25$$

$$10 + 10 + 5$$

$$89 \times 10 = 890$$

$$89 \times 10 = 890$$

$$89 \times 5 = 445$$

$$890 + 890 = 1780$$

$$1780 + 445 = 2225$$

## Student - Example B

$$89 \times 25$$

$$90 \times 20 + 90 \times 5 - 25$$

$$1,800 + 450 - 25$$

$$2,250 - 25$$

$$= 2,225$$

# Student – Example C

$$89 \times 25$$

$$= 100(25) - 11(25)$$

$$= 2,500 - 10(25) - 1(25)$$

$$= 2,500 - 250 - 25$$

$$= \textcircled{2,225}$$

$$250 - 20 - 5$$
$$230 -$$

# Student – Example D

$$89 \times 25$$

$$= (89(50)) \frac{1}{2}$$

$$= \left[ \left( (89(100)) \frac{1}{2} \right) \frac{1}{2} \right]$$

$$= \left[ (8900) \frac{1}{2} \right] \frac{1}{2}$$

$$= (4450) \frac{1}{2}$$

$$= \boxed{2225}$$

# Student – Example E

$$89 \times 25$$

$$40(25) = 1000$$

$$40(25) = 1000$$

$$4(25) = 100$$

$$5(25) = 125$$

$$\begin{array}{r} 1 \\ \hline 2225 \end{array}$$

$$\begin{array}{r} 250 \\ \hline 125 \end{array}$$

$$\begin{array}{r} 125 \\ -123 \\ \hline 100 \end{array}$$

# Student – Example F

$$89 \times 25$$

$$\begin{array}{r} 89 \\ \times 25 \\ \hline 445 \\ 178 \phantom{0} \\ \hline 2225 \end{array}$$

$$\begin{aligned} & (89 \times 10) + (89 \times 10) + (89 \times 5) \\ & 890 + 890 + 445 \\ & 1780 + 445 \\ & 2225 \end{aligned}$$

$$\begin{aligned} & (80 \times 20) + (80 \times 5) + (9 \times 20) + (9 \times 5) \\ & 1600 + 400 + 180 + 45 \\ & 2000 + 225 \\ & 2225 \end{aligned}$$

# Let's Compare Algorithms

$$\begin{array}{r} \overset{1}{\cancel{4}} \\ 89 \\ \times 25 \\ \hline 445 \\ + 178\overset{0}{0} \\ \hline 2225 \end{array}$$

## Traditional algorithms...

- Create misunderstandings
- Focuses on the digits, not the value of the numbers.

$$89 \times 25$$

$$= (80+9) (20+5)$$

$$= (80 \times 20) + (80 \times 5) + (9 \times 20) + (9 \times 5)$$

$$= 1,600 + 400 + 180 + 45$$

$$= 2,225$$

## Distributive Property....

- Is Conceptual
- Promotes thinking
- Prepares children for Algebra
- Is a big idea that connects different aspects of multiplication.

# Let's try another problem:

---

$$7 \times 4\frac{1}{9}$$

*Is this how you solved it?*

---

$$7 \times 4\frac{1}{9}$$

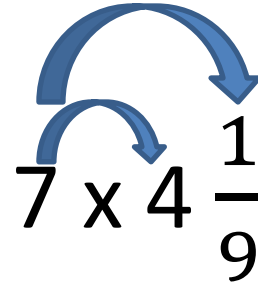

$$= \frac{7}{1} \times \frac{37}{9}$$

$$= \frac{259}{9}$$

$$= 28\frac{7}{9}$$

# Did You Know You Can Solve it with Distribution?

$$7 \times 4\frac{1}{9}$$

$$= 7(4) + 7\left(\frac{1}{9}\right)$$

$$= 28 + \frac{7}{9}$$

$$= 28\frac{7}{9}$$

# Let's Compare

$$\begin{array}{l}
 \underline{225(34)} \\
 (200 \cdot 34) + (25 \cdot 34) \text{ Distribution} \\
 6800 + [34 \cdot 100] \frac{1}{4} \text{ Substitution} \\
 6800 + \frac{1}{4}(3400) \text{ Multiplication} \\
 6800 + \frac{1}{2}(1700) \text{ Division} \\
 6800 + 850 \text{ Addition} \\
 7650
 \end{array}$$

$$\begin{array}{l}
 22\% \text{ of } 45 \\
 22 \cdot \frac{1}{100} \cdot 45 \\
 (22 \cdot 45) \left(\frac{1}{100}\right) \\
 (20(45) + 2(45)) \left(\frac{1}{100}\right) \\
 (900 + 90) \left(\frac{1}{100}\right) \\
 990 \cdot \frac{1}{100} \\
 9 \frac{90}{100} \\
 9 \frac{9}{10}
 \end{array}$$

Learning mathematics involves learning ways of thinking. It involves learning powerful mathematical ideas rather than a collection of disconnected procedures for carrying out calculations. For many children, their weakness is learning procedures without understanding. These children will never achieve understanding by practicing procedures they don't understand. Our goal in teaching mathematics is to ensure all children learn with understanding. We have found that even young children are capable of learning powerful unifying ideas of mathematics that are the foundation of both arithmetic and algebra.
